SQL-Injection-Detection-Prevention-Reporting-System

- 1. Start the XAMPP server (Apache and MySQL).
- 2. Open your browser and enter:
http://localhost/Web%20project%20(SQL%20DPR)/
- 3. The index.html file will appear on the screen.

- 4. Then, navigate to the menu and click on "Staff Login".

- 5. We tested the input fields using SQL injection payloads. The system **detected** all malicious keywords and blocked the attack, **preventing** further access.

SQL-Injection-Detection-Prevention-Reporting-System

6. The system automatically generates reports to monitor and log malicious activities with timestamps for security analysis.

Each report contains:

Date and Time of the Attack

Username Field Input

Password Field Input

Risk Level (High or Low)

```
1 Malicious activity Detected:
2 20260609_145547
3 User Data: ', select,
4 Pass Data: 1=1,
5 Risk: high
6
7
```

7. Finally, we tested the system using valid login credentials.

Username → root

Password → root

8. The authentication process was successful, and the user was redirected to the admin panel.
